Response Control and Seismic Isolation of Buildings Masahiko Higashino,Shin Okamoto,2006-09-27 This state of the art report from an international task group (TG44) of CIB, the International Council of Building Research Organizations, presents a highly authoritative guide to the application of innovative technologies on response control and seismic isolation of buildings to practice worldwide. Many countries and cities are located in earthquake-prone areas making effective seismic design a major issue in structural engineering. Reassuringly, structural response control and seismic isolation have advanced remarkably in recent years following numerous studies internationally. Several major conferences have been held and reports have been written but little has been issued on the application of the technologies to good structural engineering practice. Plugging that gap, Response Control and Seismic Isolation of Buildings presents researchers in structural engineering (dynamics) and construction management with up-to-date applications of the latest technologies.

Building Information Modeling Nawari O. Nawari,2018-02-12 Many researchers and software developers have put a lot of effort into finding solutions for automated code checking. This book is a good summary of these efforts and provides readers with a comprehensive understanding of the status of such technologies in the industry. It also guides readers on implementation of such techniques using the platforms and tools currently available in the industry. — Issa Ramaji, University of North Florida, USA Building Information Modeling: Automated Code Checking and Compliance Processes covers current and emerging trends in automating the processes of examining building design against codes and standards of practice. The role of Building Information Modeling (BIM) technologies in these processes is thoroughly analyzed and explains how this new technology is significantly transforming modern architecture, engineering, and construction (AEC) domains. The book also introduces the theoretical background of computerizing compliance verification, including domain knowledge representations, building model representations, and automated code checking systems. An underlying goal for the material covered is to present the use of BIM technology as an integral part of the automated auditing process that can lead to a more comprehensive, intelligent, and integrated building design- a design where an optimized solution can be achieved in harmony with the current codes and standards of practice. This new proposed BIM-based framework for

automating code conformance checking is one of the most powerful methods presently available to reflect actual building code requirements, and the methods described in the book offer significant benefits to the AEC industry such as: Providing consistency in interpretation of regulatory provisions Reducing code compliance validation errors, and the cost and time associated with compliance checking Allows for the ability to self-check required aspects before bidding Reduces the amount of time and resources required during design review Allows for optimal design, along with faster turnaround on feedback, and potentially faster approvals for construction permits by building and infrastructure authorities

Buildings and Structures under Extreme Loads Chiara Bedon, Flavio Stochino, Daniel Honfi, 2020-11-25 Exceptional loads on buildings and structures may have different causes, including high-strain dynamic effects due to natural hazards, man-made attacks, and accidents, as well as extreme operational conditions (severe temperature variations, humidity, etc.). All of these aspects can be critical for specific structural typologies and/or materials that are particularly sensitive to external conditions. In this regard, dedicated and refined methods are required for their design, analysis, and maintenance under the expected lifetime. There are major challenges related to the structural typology and material properties with respect to the key features of the imposed design load. Further issues can be derived from the need for risk mitigation or retrofit of existing structures as well as from the optimal and safe design of innovative materials/systems. Finally, in some cases, no appropriate design recommendations are available and, thus, experimental investigations can have a key role within the overall process. In this Special Issue, original research studies, review papers, and experimental and/or numerical investigations are presented for the structural performance assessment of buildings and structures under various extreme conditions that are of interest for design.

OECD Economic Surveys: Korea 2022 OECD, 2022-09-19 Sound health management and supportive policies helped Korea emerge swiftly from the pandemic. The recovery is set to continue as pandemic-era restrictions on contact-intensive services are shelved, despite the Russia-Ukraine war raising inflation and highlighting the need to increase supply chain resilience.

Concrete Structures in Earthquake Thomas T. C. Hsu, 2019-01-21 This book gathers 23 papers by top experts from 11 countries, presented at the 3rd Houston International Forum: Concrete Structures in Earthquake. Designing infrastructures to resist earthquakes has always been the focus and mission of scientists and engineers located in tectonically active regions, especially around the “Pacific Rim of Fire” including China, Japan, and the USA. The pace of research and innovation has accelerated in the past three decades, reflecting the need to mitigate the risk of severe damage to interconnected infrastructures, and to facilitate the incorporation of high-speed computers and the internet. The respective papers focus on the design and analysis of concrete structures subjected to earthquakes, advance the state of knowledge in disaster mitigation, and address the safety of infrastructures in general.

Advanced Methods for Seismic Performance Evaluation of Building Structures Sang Whan Han,2021-01-21 This Special Issue was created to collect the most recent and novel research on seismic performance evaluation of building structures. This issue includes three important topics on seismic engineering for building structures: (1) seismic design and performance evaluation, (2) structural dynamics, and (3) seismic hazard and risk analysis. To protect building structures from earthquakes, it is necessary to conduct seismic performance evaluations on structures with reliable methods and to retrofit these structures appropriately using the results of the seismic performance evaluation.

PV System Design and Performance Wilfried van Sark,2019-11-22 Photovoltaic solar energy technology (PV) has been developing rapidly in the past decades, leading to a multi-billion-dollar global market. It is of paramount importance that PV systems function properly, which requires the generation of expected energy both for small-scale systems that consist of a few solar modules and for very large-scale systems containing millions of modules. This book increases the understanding of the issues relevant to PV system design and correlated performance; moreover, it contains research from scholars across the globe in the fields of data analysis and data mapping for the optimal performance of PV systems, faults analysis, various causes for energy loss, and design and integration issues. The chapters in this book demonstrate the importance of designing and properly monitoring photovoltaic systems in the field in order to ensure continued good performance.

Architecture and Urbanism in Modern Korea Inha Jung,2013-07-31 Although modernization in Korea started more than a century later than in the West, it has worked as a prominent ideology throughout the past century—in particular it has brought radical changes in Korean architecture and cities. Traditional structures and ways of life have been thoroughly uprooted in modernity’s continuous negation of the past. This book presents a comprehensive overview of architectural development and urbanization in Korea within the broad framework of modernization. Twentieth-century Korean architecture and cities form three distinctive periods. The first, defined as colonial modern, occurred between the early twentieth century and 1945, when Western civilization was transplanted to Korea via Japan, and a modern way of life, albeit distorted, began taking shape. The second is the so-called developmental dictatorship period. Between 1961 and 1988, the explosive growth of urban populations resulted in large-scale construction booms, and architects delved into modern identity through the locality

of traditional architecture. The last period began in the mid-1990s and may be defined as one of modernization settlement and a transition to globalization. With city populations leveling out, urbanization and architecture came to be viewed from new perspectives. Inha Jung, however, contends that what is more significant is the identification of elements that have remained unchanged. Jung identifies continuities that have been formed by long-standing relationships between humans and their built environment and, despite rapid modernization, are still deeply rooted in the Korean way of life. For this reason, in the twentieth century, regionalism exerted a great influence on Korean architects. Various architectural and urban principles that Koreans developed over a long period while adapting to the natural environment have provided important foundations for architects' works. By exploring these sources, this carefully researched and amply illustrated book makes an original contribution to defining modern identity in Korea's architecture, housing, and urbanism.

Architecture in Development Aggregate Architectural History Collaborative, 2022-04-25 This extensive text investigates how architects, planners, and other related experts responded to the contexts and discourses of "development" after World War II. Development theory did not manifest itself in tracts of economic and political theory alone. It manifested itself in every sphere of expression where economic predicaments might be seen to impinge on cultural factors. Architecture appears in development discourse as a terrain between culture and economics, in that practitioners took on the mantle of modernist expression while also acquiring government contracts and immersing themselves in bureaucratic processes. This book considers how, for a brief period, architects, planners, structural engineers, and various practitioners of the built environment employed themselves in designing all the intimate spheres of life, but from a consolidated space of expertise. Seen in these terms, development was, to cite Arturo Escobar, an immense design project itself, one that requires radical disassembly and rethinking beyond the umbrella terms of "global modernism" and "colonial modernities," which risk erasing the sinews of conflict encountered in globalizing and modernizing architecture. Encompassing countries as diverse as Israel, Ghana, Greece, Belgium, France, India, Mexico, the United States, Venezuela, the Philippines, South Korea, Sierra Leone, Singapore, Turkey, Cyprus, Iraq, Zambia, and Canada, the set of essays in this book cannot be considered exhaustive, nor a "field guide" in the traditional sense. Instead, it offers theoretical reflections "from the field," based on extensive archival research. This book sets out to examine the arrays of power, resources, technologies, networking, and knowledge that cluster around the term development, and the manner in which architects and planners negotiated these thickets in their multiple capacities—as knowledge experts, as technicians, as negotiators, and as occasional authorities on settlements, space, domesticity, education, health, and every other field where arguments for development were made.

Civil Structural Health Monitoring Carlo Rainieri, Giovanni Fabbrocino, Nicola Caterino, Francesca Ceroni, Matilde A. Notarangelo, 2021-08-24 This volume gathers the latest advances and innovations in the field of structural health monitoring, as presented at the 8th Civil Structural Health Monitoring Workshop (CSHM-8), held on March 31–April 2, 2021. It discusses

emerging challenges in civil SHM and more broadly in the fields of smart materials and intelligent systems for civil engineering applications. The contributions cover a diverse range of topics, including applications of SHM to civil structures and infrastructures, innovative sensing solutions for SHM, data-driven damage detection techniques, nonlinear systems and analysis techniques, influence of environmental and operational conditions, aging structures and infrastructures in hazardous environments, and SHM in earthquake prone regions. Selected by means of a rigorous peer-review process, they will spur novel research directions and foster future multidisciplinary collaborations.
